

How to setup Nextgen to track vaccinations for non-clinic patients

Using Patient Status Field

by Northeast Valley Health Corp.

The Patient Status field is a Patient Level data field compared to an encounter level data field

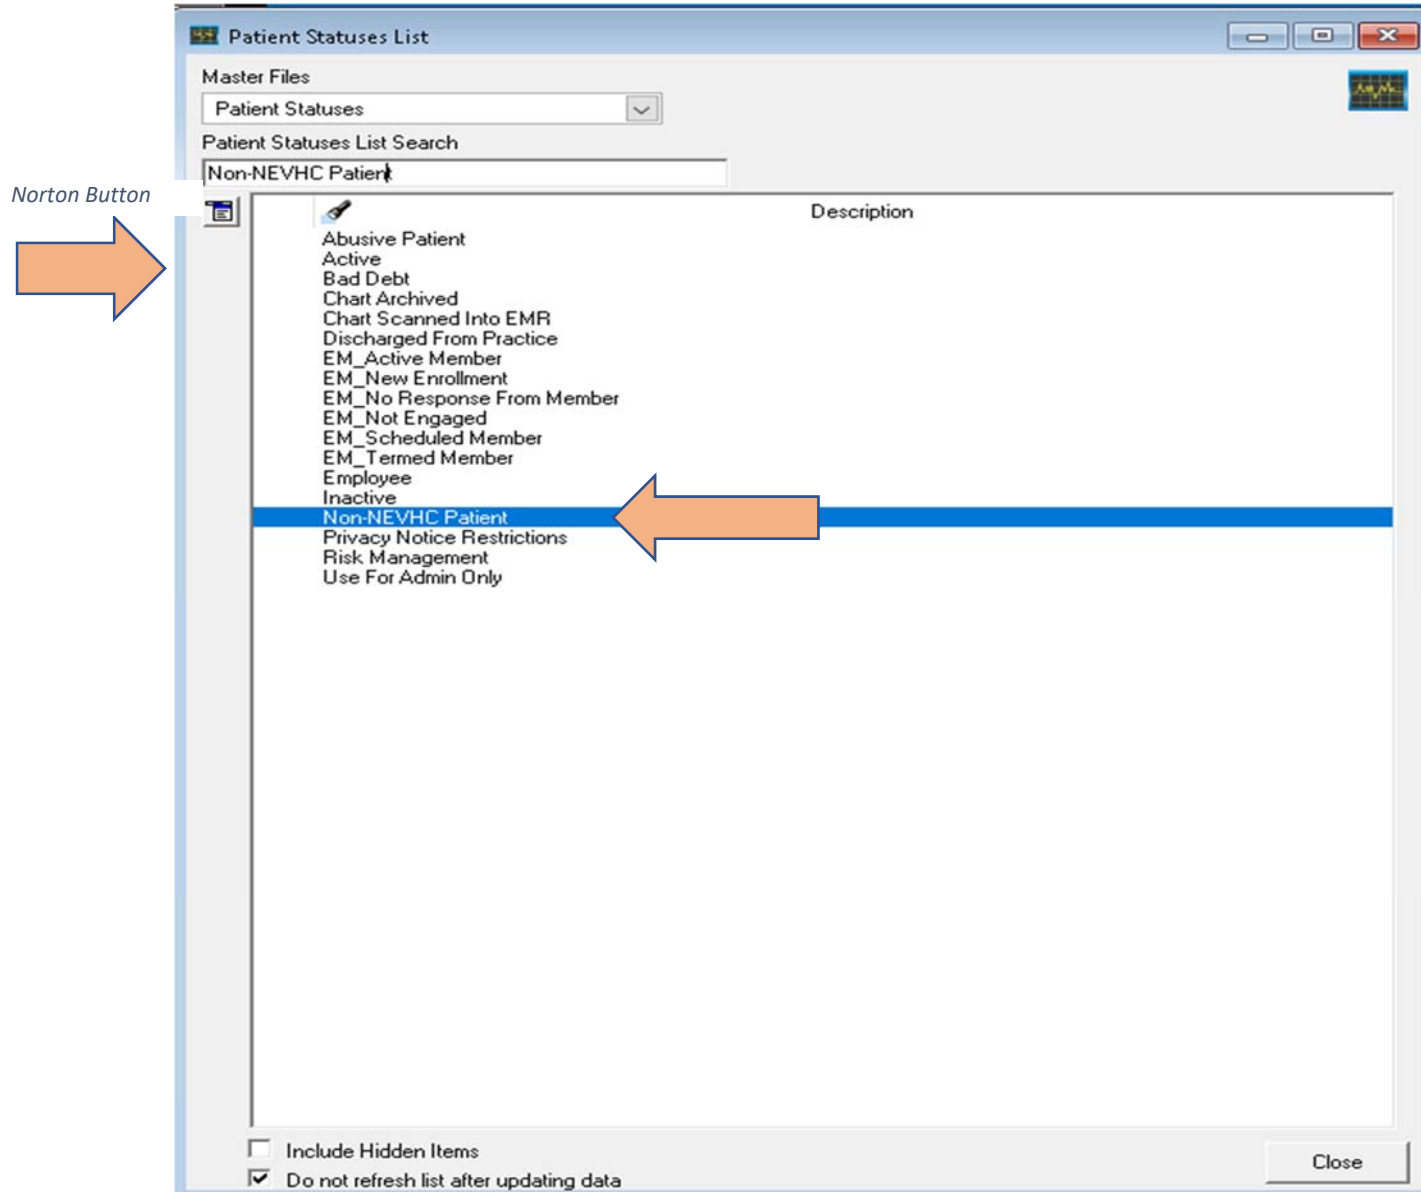

The menu choices for this field are defined at the Practice level under PM

The existing Patient Status List will display

Use the Norton Button to add a new Patient Status selection

The new selection will now be available to use when staff are registering a new community member for a Covid Vaccine or Covid Test. The selection name should be customized for your own facility.

The Patient Status field can then be used to filter out these patients and encounters for internal and external reporting, or included when running reports on how many community members were seen.
